

Keep Your View **Crystal Clear**

To ensure your window film continues to perform at its best, proper care and maintenance are key. This guide will provide you with easy-to-follow tips to keep your windows looking pristine and your film in top condition.

Wait Before Cleaning

DO wait at least 30 days before cleaning your window film to allow it to cure and adhere to the glass.

Avoid Harsh Chemicals

DON'T use ammonia-based cleaners, bleach, vinegar, or any abrasive cleaning solutions. These can damage the film or cause it to discolor.

Use Mild Cleaning Solutions

DO clean your windows with a mild soap and water solution. A few drops of dish soap mixed with water works well.

No Sharp Objective or Abrasive Tools

DON'T use rough cloths, brushes, or razor blades on the film. These can scratch, peel, or puncture the film.

Clean with Squeegees or a Soft Cloth

DO use a rubber squeegee or soft microfiber cloth to prevent scratching and ensure a streak-free finish.

Don't Tape or Stick Objects to Film

DON'T apply adhesive tapes, stickers, or decals directly onto the window film. These can leave residues or cause the film to peel when removed.

Be Gentle

DO exercise care. Window film has a durable, scratch resistant coating to withstand normal use. However, we recommend avoiding abrasion.
